MIGHTX7

WHITE PAPER v3.0 · MAINNET EDITION

Real-world seafood resource recovery × Web3 infrastructure

Project	MIGHTX7
Company / Developer	CHIKARA CO., LTD. · Japan
Founder / Director	Denis Komissarov
Blockchain	BNB Smart Chain (BEP-20)
Mainnet contract	0xc02B3EE1237e4bF485bE9D1dA12e815fcDa54687
Total supply	1,000,000,000 MIGHTX7
Document date	12 October 2026

Purpose of this document

This white paper describes the MIGHTX7 project, its current blockchain deployment, planned ecosystem direction, token allocation and principal risks. It is informational and does not promise token value, investment returns, exchange admission or completion of future business plans.

1. Executive summary

MIGHTX7 is a digital-asset and Web3 ecosystem project developed by CHIKARA CO., LTD., a company based in Japan. The project combines a token deployed on BNB Smart Chain with a longer-term business direction in seafood processing and resource recovery.

The real-world business concept is to make better use of seafood-processing by-products. Subject to financing, site selection, equipment procurement, permits and environmental and food-safety requirements, CHIKARA intends to evaluate processing fish by-products into fishmeal and fish oil. These products may provide additional value from materials that would otherwise require disposal.

MIGHTX7 is an early-stage project. The industrial plan and future ecosystem features are under development and are not represented as completed or guaranteed.

2. Company and project team

Developer: CHIKARA CO., LTD., Japan. Founder / Director: Denis Komissarov. The company's business direction includes seafood-related processing and the planned utilization of fish-processing by-products.

The project's official information channels are listed in Section 11. Users should rely on those channels for project communications and verify blockchain transactions independently through the BNB Smart Chain explorer.

3. Blockchain and token information

MIGHTX7 is deployed on BNB Smart Chain using the BEP-20 token standard. The production contract address shown for this document is:

0xc02B3EE1237e4bF485bE9D1dA12e815fcDa54687

The stated maximum total supply is 1,000,000,000 MIGHTX7. The project documentation describes a fixed supply and no public post-deployment mint function; users should independently inspect the verified contract source code and on-chain data. This document does not replace a technical audit.

4. Project concept and development pillars

Web3 infrastructure: maintain the token and project information on BNB Smart Chain, publish documentation, and support community communication.

Seafood resource recovery: evaluate ways to recover value from fish-processing by-products, including possible fishmeal and fish-oil production.

Transparency: publish consistent token information, explain planned versus completed milestones, and avoid representing targets as achieved results.

Future ecosystem: explore community activities, integrations and additional functions only after technical, commercial and legal review. No unannounced utility should be assumed to exist today.

5. Real-world business plan

CHIKARA's proposed industrial direction is the processing of fish-processing by-products into fishmeal and fish oil. Before implementation, the company must confirm feedstock supply, processing technology, facility suitability, equipment performance, waste and odor controls, utilities, staffing, product specifications, sales channels and applicable Japanese regulatory requirements.

Project execution depends on available capital, commercial agreements, technical validation, permits and environmental and operational requirements. No production start date, output volume, revenue or profit is guaranteed in this white paper.

The industrial business and the token are related at the project-ecosystem level, but MIGHTX7 does not represent shares in CHIKARA CO., LTD. and does not, by itself, grant ownership of company assets or a guaranteed entitlement to company revenue or profits.

6. Token allocation

The project's stated allocation plan is shown below. Allocation describes the project's planned distribution categories; it should not be interpreted as proof that every allocation is already distributed, locked, vested or held in a specific wallet. Actual balances and lock status must be confirmed from on-chain records.

Allocation	Tokens	Share
Founder / Project	500,000,000	50%
Public Sale Allocation	300,000,000	30%
Community / Gifts	50,000,000	5%
CHIKARA Founder Allocation	150,000,000	15%
TOTAL	1,000,000,000	100%

Planned public distribution terms have previously been discussed as a reference price of ¥0.40 per token and phased allocations. These are not a guarantee of a sale or market price. Any public distribution must be reviewed for applicable laws, jurisdiction restrictions, platform rules and compliance requirements before it is activated.

7. Token utility and limitations

Potential future ecosystem functions may include community participation, Web3 integrations, access to selected project activities or services, and other features announced after implementation and review. These are possibilities, not a representation that such functions are currently available.

MIGHTX7 is not a share, deposit, bond or ownership interest in CHIKARA CO., LTD. Unless a separate legally valid instrument expressly states otherwise, holding MIGHTX7 does not provide corporate voting rights, company ownership or a contractual right to profits.

8. Roadmap

Foundation: token deployment, project identity, website and documentation.

Documentation and transparency: maintain public project information and provide consistent details for token-information and exchange due-diligence reviews.

Industrial feasibility: evaluate feedstock, equipment, site, utilities, permits, environmental measures and product-market requirements for fishmeal and fish-oil production.

International market preparation: assess potential exchange applications and jurisdictional requirements. Applications and listings remain subject to independent approval.

Ecosystem development: consider additional functions and partnerships when technically feasible and legally reviewed.

9. Risks

Digital assets involve substantial risk, including price volatility, limited liquidity, market manipulation, cybersecurity incidents, wallet compromise, blockchain congestion or failure, smart-contract defects, regulatory changes, exchange rejection or delisting, and possible total loss of value.

The business plan also faces financing, equipment, construction, supply, operating-cost, environmental, permitting, product-quality and market-demand risks. The project may be delayed, changed or discontinued.

No future token price, profit, return, liquidity level, production result, partnership or exchange listing is promised. Past or current DEX activity is not evidence of future demand.

10. Compliance and important notices

This document is for general information only. It is not financial, investment, legal, tax or accounting advice and is not an offer or solicitation to buy or sell a digital asset.

Token distribution, marketing, availability by jurisdiction and any exchange activity must be assessed against applicable law and platform requirements. The project must not imply that a BscScan token-information update is an endorsement, audit, certification, or exchange listing.

Any figures in this document are project statements and plans, not independently audited financial projections. No security audit is claimed in this document.
